3.5 case-based or rule-based

ICML 2024 | Transformer 究竟如何推理？基于样例还是基于规则

Case-Based or Rule-Based: How Do Transformers Do the Math?

https://github.com/GraphPKU/Case_or_Rule

4 LLM 常见难题

4.1 重复生成

https://www.zhihu.com/question/616130636

https://mp.weixin.qq.com/s/cSwWapqFhxu9zafzPUeVEw

4.2 幻觉

4.2.1 综述

OpenAI Lilian Weng 万字长文解读 LLM 幻觉：从理解到克服

https://lilianweng.github.io/posts/2024-07-07-hallucination/

4.2.2 语义熵

语义熵识破 LLM 幻觉！牛津大学新研究登 Nature

Detecting hallucinations in large language models using semantic entropy

4.3 知识冲突

深度解析 RAG 大模型知识冲突，清华西湖大学港中文联合发布

Knowledge Conflicts for LLMs: A Survey

4.4 llm+db

长文本杀不死 RAG：SQL+ 向量驱动大模型和大数据新范式，MyScale AI 数据库正式开源

https://github.com/myscale/myscaledb

4.5 Zilliz

向量数据库的中场战事：长期主义者 Zilliz 如何全球突围

4.6 记忆能力

Localizing Paragraph Memorization in Language Models

对应代码：https://github.com/googleinterns/localizing-paragraph-memorization

我们能否定位出语言模型中用于记忆其训练数据中整段文字的权重和机制?

- 尽管记忆现象分布在模型的多个层级和组件中，但记忆段落的梯度在空间上有可辨别的模式，即**在较低模型层级的梯度比非记忆 example 的梯度大**。
- 通过**仅微调高梯度的权重**，可以使模型**遗忘记忆的 example**。
- 定位了一个特别参与段落记忆的**低层注意力头**，它**主要关注**在语料库级单词频率分布中**最不频繁出现的独特、罕见的 token**。
- 总的来说，相较非记忆的续写，记忆续写不仅**更难以遗忘**，也**更难以损坏**。

4.6.1 reasoning

Reasoning or Reciting? Exploring the Capabilities and Limitations of Language Models Through Counterfactual Tasks MIT 的

Do Large Language Models Latently Perform Multi-Hop Reasoning? deepmind 的

How do Language Models Bind Entities in Context? UC berkeley 的，ICLR2024

4.13 道德风险

GPT-4o 模仿人类声音，诡异尖叫引 OpenAI 研究员恐慌！32 页技术报告出炉

openai 的报告：GPT-4o System Card

之前 deepmind 也有一个报告The Ethics of Advanced AI Assistants

4.14 选择性偏差

ACL2024| 大模型选择偏差在腾讯广告特征评测上的优化及应用

Strengthened Symbol Binding Makes Large Language Models Reliable Multiple-Choice Selectors

给定一个问题 (question) 及其对应的选项内容 (options)，大模型无法把选项内容 (option content) 和对应的选项标识符 (symbol，特指选项标识 A/B/C/D) 关联到一起。例如，当把正确答案”the president”放到选项 B 时，模型能够正确选择出答案；当我们把正确答案放到 C 时，模型依然选择”B”，即模型偏向于选”B”或者第二个答案，而忽略了正确答案的内容。

4.15 lost in the middle

Lost in the Middle: How Language Models Use Long Contexts

4.16 reasoning boundary

NeurIPS 2024 (Oral) | 如何量化与提升思维链的推理能力边界?

Unlocking the Capabilities of Thought: A Reasoning Boundary Framework to Quantify and Optimize Chain-of-Thought

https://github.com/LightChen233/reasoning-boundary

4.17 语言 ≠ 思维

语言 ≠ 思维，大模型学不了推理：一篇 Nature 让 AI 社区炸锅了

https://www.nature.com/articles/s41586-024-07522-w

5 多智能体

《综述：全新大语言模型驱动的 Agent》——4.5 万字详细解读复旦 NLP 和米哈游最新 Agent Survey

Agent > GPT5? 吴恩达最新演讲：四种 Agent 设计范式（通俗易懂版）

5.1 JAT

告别偏科，能玩转多模态、多任务、多领域的强化智能体终于来了

Jack of All Trades, Master of Some, a Multi-Purpose Transformer Agent

https://github.com/huggingface/jat

https://huggingface.co/datasets/jat-project/jat-dataset

输入的序列元素是 observations, actions, 和 rewards 的交替组合：

$$[\phi(s_0, 0.0), \phi(a_0), \phi(s_1, r_1), \phi(a_1), ...]$$

依据不同输入的数据类型，使用不同网络处理：

- 图像：用 CNN。
- 连续向量：用线性层
- 离散值：用线性投影层

预测任务：根据所有先前的观察和动作嵌入来预测下一个动作嵌入。

序列的构造方法：

- 和文本相关的任务：用 GPT-2 的分词策略，将文本转换为一个整数序列，然后 emb lookup 映射到一个嵌入向量序列。
- 和图像有关的任务：用 ViT，将图像切割成小块后，通过线性层转换为嵌入向量序列。
- 最终再将图像和文本的向量序列拼接在一起，形成一个统一的序列，输入到 Transformer 中。

5.2 ReadAgent

「有效上下文」提升 20 倍！DeepMind 发布 ReadAgent 框架

5.3 多模态 agent

一文详解多模态智能体（LMAs）最新进展（核心组件/分类/评估/应用）

Large Multimodal Agents: A Survey

https://github.com/jun0wanan/awesome-large-multimodal-agents

5.4 OpenDevin

OpenDevin 出技术报告了，大模型 Agent 开发者必读

OpenDevin: An Open Platform for AI Software Developers as Generalist Agents

5.5 autogpt

GitHub 星标超 16 万，爆火 AutoGPT 进阶版来了：定制节点、多智能体协同

https://github.com/Significant-Gravitas/AutoGPT

5.6 DAAG

三「模」联盟，谷歌 DeepMind 缔造终身学习智能体！

Diffusion Augmented Agents: A Framework for Efficient Exploration and Transfer Learning

5.7 VARP

GPT-4o 能玩《黑神话》！精英怪胜率超人类，无强化学习纯大模型方案

Can VLMs Play Action Role-Playing Games? Take Black Myth Wukong as a Study Case

5.8 MARL

北大领衔，多智能体强化学习研究登上 Nature 子刊

Efficient and scalable reinforcement learning for large-scale network control

5.9 MMRole

与「李白」赏图赋诗，同「猴哥」直面天命，人大高瓴提出 MMRole 多模态角色扮演

MMRole: A Comprehensive Framework for Developing and Evaluating Multimodal Role-Playing Agents

https://github.com/YanqiDai/MMRole

5.10 Swarm

OpenAI 今天 Open 了一下：开源多智能体框架 Swarm

https://github.com/openai/swarm

5.11 agent-as-a-judge

卷起来！让智能体评估智能体，Meta 发布 Agent-as-a-Judge

Agent-as-a-Judge: Evaluate Agents with Agents

https://github.com/metauto-ai/agent-as-a-judge

5.12 Hammer

哪个模型擅长调用工具？这个 7B 模型跻身工具调用综合榜单第一

Hammer: Robust Function-Calling for On-Device Language Models via Function Masking

https://huggingface.co/MadeAgents

https://github.com/MadeAgents/Hammer

5.13 AgentOccam

不靠更复杂的策略，仅凭和大模型训练对齐，零样本零经验单 LLM 调用，成为网络任务智能体新 SOTA

AgentOccam: A Simple Yet Strong Baseline for LLM-Based Web Agents

5.14 苏格拉底学习

DeepMind 用语言游戏让大模型学 AlphaGo 自我博弈，数据限制不存在了

Boundless Socratic Learning with Language Games

5.15 从个人模拟到社会模拟

智能体模拟《西部世界》一样的社会，复旦大学等出了篇系统综述

From Individual to Society: A Survey on Social Simulation Driven by Large Language Model-based Agents

6 一些其他比较重要的工作

6.1 几篇出现频率比较高的论文

Scaling instruction-finetuned language models 引用数 800+

How can we know what language models know? 引用数 800+

Chain of thought prompting elicits reasoning in large language models引用 1800+

6.2 Anthropic 的一些工作

LLM 惊现篡改代码获得奖励，欺骗人类无法根除逆转！Anthropic 新作揭露惊人真相

SYCOPHANCY TO SUBTERFUGE: INVESTIGATING REWARD TAMPERING IN LANGUAGE MODELS

7 个性化搜索

随便找一篇Denoising Attention for Query-aware User Modeling in Personalized Search，来看看它的参考文献：

学术界：

- A Transformer-based Embedding Model for Personalized Product Search，sigir20
- Learning a Fine-Grained Review-based Transformer Model for Personalized Product Search，sigir21

- RLPer: A Reinforcement Learning Model for Personalized Search，www20

工业界：

- A Zero Attention Model for Personalized Product Search，CIKM19，亚马逊
- Real-time Personalization using Embeddings for Search Ranking at Airbnb，KDD18，airbnb
- End-to-End Deep Attentive Personalized Item Retrieval for Online Content-sharing Platforms，www20，Google
- Towards Personalized and Semantic Retrieval: An End-to-End Solution for E-commerce Search via Embedding Learning，sigir20，京东
- Personalized Query Suggestions，sigir20，LinkedIn
- A GNN-based Multi-task Learning Framework for Personalized Video Search，WSDM22，百度

7.1 q-i 双塔的改进

7.1.1 引入 location+social

Embedding-based Retrieval in Facebook Search，KDD20

q-d 双塔结构，在两个塔的最底层均加入：

- location：用户所处地理位置，如城市
- social：facebook 是社交网络，通过另一个基于 graph 的模型训练得到的 user 和 item emb，直接加进来

7.1.2 引入用户行为序列

Encoding History with Context-aware Representation Learning for Personalized Search，sigir20，人大，提出 HTPS

Figure 1: The architecture of the query disambiguation model. Given a new query, we encode the query terms, short-term history, and long-term history as contextual information separately with hierarchical transformer to disambiguate the current query .

把用户历史的 q-d pair 对和当前 query 一起，过短期 transformer 和长期 transformer 得到输出 q^l。

Figure 2: The architecture of the personalized language model, which is used to learn the user's personalized search pattern. We first enhance the queries in the current session based on historical patterns, and then summarize them to predict the current intent. Finally, we combine two models with a gate unit.

把 q^l 加上 [mask]，过 transoformer 得到预估的 intent q^p

然后将 q^l 和 q^p 通过 gate nn 融合得到最终的 context-aware 的 query 表示 q^f

最终 doc 和 query 的打分包括两部分，通过 ϕ（一个 MLP，激活是 tanh）进行融合：

$$p(d \mid q, H) = \phi\left(p(d, q), p\left(d, q^H\right)\right)$$

- $p(d, q)$：q 和 d 的语义相似度，可以用正常的 nlp 模型得到
- $p\left(d, q^H\right)$：q 和 d 的个性化得分，公式如下，其中 s^R 是 cos：

$$p\left(d, q^H\right) = \phi\left(s^R\left(q^s, d^w\right), s^R\left(q^l, d^w\right), s^R\left(q^p, d^w\right), s^R\left(q^f, d^w\right)\right)$$

有两个 loss：

- pred loss：预估 intent，即下一个 query，拿 q^p 与下一个 query 中各个词向量的 avg 算 cos
- rank loss：依据 $p(d \mid q, H)$ 算 lambda rank 的 pairwise loss

7.1.3 三塔 +gnn 邻居 +mtl

A GNN-based Multi-task Learning Framework for Personalized Video Search，WSDM22，百度，提出 MGNN-PVS

现有的 PSM(g personalized search methods) 大多使用用户反馈（如点击）进行训练，缺点：

- 反馈信号大部分表达的是吸引力而非相关性
- 用户的历史信号比较稀疏，很难学好 PSM

两张二部图：u-q 和 q-d

Figure 4: An illustration of our GNN-based multi-task framework. Given the triple <u_u, q_q, d_d>, we first apply the QTMM and I3D to learn the semantic representations of q_q and d_d. Then, we sample fixed-size neighbors for u_u, q_q, d_d from the u-q and q-d graphs and leverage the graph information with the proposed hierarchical GNN architecture simultaneously capturing both local and higher-order interactions among nodes to enhance their representation. Finally, we combine representations learned from text, video and graph for the click task and query-video relevance task for personalized video search.

3 个塔：

- user：
  - user 自己
  - 一跳邻居（u->q）的 q
  - 二跳邻居（u->q->u）的 u
- query：
  - query 自己
  - 一跳邻居（q->d）的 doc
  - 二跳邻居（q->d->q）的 query
- doc：
  - doc 自己的 title 向量（训练 query-正 title-负 title 的 triplet loss）和 video 向量（训练 video-正 query-负 query 的 triplet loss）
  - 二跳邻居（d->q->d）的 doc

两个 task：

- ctr 预估：u 和 q 拼一起过 nn 得到个性化的 q，再和 d 过 nn 得到的向量算内积，得到预估值，用交叉熵
- 相关性预估：q 过另一个 nn，d 过另一个 nn，内积，用 mse

8 RAG

https://github.com/NirDiamant/Prompt_Engineering

吴恩达：四个步骤，让大模型变得更好

Can Generalist Foundation Models Outcompete Special-Purpose Tuning? Case Study in Medicine

让 gpt4 生成 cot 和答案的模板

Self-generated Chain-of-thought Template

```
## Question: {{question}}
{{answer_choices}}
## Answer
```
model generated chain of thought explanation

Therefore, the answer is [*final model answer (e.g. A,B,C,D)*]

Algorithm 1 Algorithmic specification of Medprompt, corresponding to the visual representation of the strategy in Figure 4.

Input: Development data $\mathcal{D}$, Test question Q
Preprocessing:
for each question q in $\mathcal{D}$ **do**
  Get an embedding vector v_q for q.
  Generate a chain-of-thought C_q and an answer A_q with the LLM.
  if Answer A_q is correct **then**
    Store the embedding vector v_q, chain-of-thought C_q, and answer A_q.
  end if
end for

Inference Time:
Compute the embedding v_Q for the test question Q.
Select the 5 most similar examples $\{(v_{Q_i}, C_{Q_i}, A_{Q_i})\}_{i=1}^{5}$ from the preprocessed training data using KNN, with the distance function as the cosine similarity: $\text{dist}(v_q, v_Q) = 1 - \frac{\langle v_q, v_Q \rangle}{\|v_q\| \|v_Q\|}$.
Format the 5 examples as context $\mathcal{C}$ for the LLM.
for 5 times **do**
  Shuffle the answer choices of the test question.
  Generate a chain-of-thought C_q^k and an answer A_q^k with the LLM and context $\mathcal{C}$.
end for
Compute the majority vote of the generated answers $\{A_q^k\}_{k=1}^{K}$:

$$A^{\text{Final}} = \text{mode}(\{A_q^k\}_{k=1}^{K}),$$

where $\text{mode}(X)$ denotes the most common element in the set X.
Output: Final answer A^{Final}.

看着是借助 GPT4+COT+RAG+ 投票

- 拿一坨 question 得到他们的向量，并按照上图的模板让 gpt 生成 COT 和答案，人工判断，对的存进知识库里

- 预测阶段：
  - 拿测试 question 的向量从知识库里查出 5 个最像 (cos 距离) 的 (q, cot, answer) 作为 context
  - 循环 5 次：shuffle 测试 question 的答案选项，让 LLM 回答
  - 对生成的答案投票，选票数最多的

18.6 swiftsage

大语言模型在开放世界中的推理能力探索实践

SwiftSage: A Generative Agent with Fast and Slow Thinking for Complex Interactive Tasks

18.7 达摩院大模型技术交流

https://developer.aliyun.com/live/248332

ppt：链接 密码：5yyf

18.8 回译

通过单语数据提升 NMT 模型最高效的方法之一是回译（back-translation）。如果我们的目标是训练一个英语到德语的翻译模型，那么可以首先训练一个从德语到英语的翻译模型，并利用该模型翻译所有的单语德语数据。然后基于原始的英语到德语数据，再加上新生成的数据，我们就能训练一个英语到德语的最终模型。

Understanding Back-Translation at Scale

18.9 nan 问题

解决 pytorch 半精度 amp 训练 nan 问题

18.10 时间序列

LLM 用于时序预测真的不行，连推理能力都没用到

Are Language Models Actually Useful for Time Series Forecasting?

18.11 人脑

MIT 大牛新作震惊学界！AI「长脑子」了？LLM 惊现「人类脑叶」结构并有数学代码分区

The Geometry of Concepts: Sparse Autoencoder Feature Structure

18.12 LLM for 算法设计

调研 180 多篇论文，这篇综述终于把大模型做算法设计理清了

A Systematic Survey on Large Language Models for Algorithm Design

18.13 深度生成模型课程

教授何恺明在 MIT 的第二门课——《深度生成模型》，讲座 PPT 陆续已出

19 一些记录

19.1 打印模型参数量

https://stackoverflow.com/questions/49201236/check-the-total-number-of-parameters-in-a-pytorch-model

```
pytorch_total_params = sum(p.numel() for p in model.parameters())

pytorch_total_trainable_params = sum(p.numel() for p in model.parameters() if p.requires_grad)

# Load the model
from transformers import BartForConditionalGeneration
from transformers import T5ForConditionalGeneration
def cal(model):
  pytorch_total_trainable_params = sum(p.numel() for p in model.parameters() if p.requires_grad)
  return pytorch_total_trainable_params

model = BartForConditionalGeneration.from_pretrained("facebook/bart-base")
print("bart-base")
print(cal(model)) # 6L 139420416 139M

model = BartForConditionalGeneration.from_pretrained("facebook/bart-base")
print("bart-base")
print(cal(model)) # 12L 406291456 406M

model = T5ForConditionalGeneration.from_pretrained("t5-small")
print("t5-small")
print(cal(model)) # 6L 60506624 65M

model = T5ForConditionalGeneration.from_pretrained("t5-base")
print("t5-base")
print(cal(model)) # 12L 222903552 223M

model = T5ForConditionalGeneration.from_pretrained("t5-large")
print("t5-large")
print(cal(model)) # 24L 737668096 738M
```

19.2 往现有 tokenizer 里加一些特殊 token

https://stackoverflow.com/questions/69191305/how-to-add-new-special-token-to-the-tokenizer

```
num_added_toks = tokenizer.add_tokens(['[EOT]'], special_tokens=True) ##This line is updated
model.resize_token_embeddings(len(tokenizer))

###The tokenizer has to be saved if it has to be reused
tokenizer.save_pretrained(<output_dir>)
```

示例

```
from transformers import AutoTokenizer, AutoModelForSequenceClassification
tokenizer = AutoTokenizer.from_pretrained("bert-base-uncased")

print("Before")
print(tokenizer.all_special_tokens) # --> ['[UNK]', '[SEP]', '[PAD]', '[CLS]', '[MASK]']
print(tokenizer.all_special_ids)    # --> [100, 102, 0, 101, 103]

special_tokens_dict = {'additional_special_tokens': ['[EOT]']}
num_added_toks = tokenizer.add_special_tokens(special_tokens_dict)
# model.resize_token_embeddings(len(tokenizer))  # --> Embedding(30523, 768)

tok_id = tokenizer.convert_tokens_to_ids('[EOT]')  # --> 30522

print("After")
print(tokenizer.all_special_tokens) # --> ['[UNK]', '[SEP]', '[PAD]', '[CLS]', '[MASK]']
print(tokenizer.all_special_ids)    # --> [100, 102, 0, 101, 103]
```

19.3 python 的读写锁

一个写，多个并行读：https://pypi.org/project/readerwriterlock/

19.4 pytorch 的显存泄露

https://github.com/pytorch/pytorch/issues/13246#issuecomment-445770039

19.5 torch profiling

https://pytorch.org/tutorials/recipes/recipes/profiler_recipe.html

可以拿这个来可视化：https://ui.perfetto.dev/

- 点击 open trace file 上传 json 文件
- timeline 中有两个 python 进程，点击 cuda kernel 会出现箭头，方便找到是**哪个 op 调用了该 kernel**
  - 靠上的 python 进程是 host 侧进程（主要是用户代码中调用的一些 **API/pytorch op**，能比较方便能和训练代码对应上）
  - 靠下的 python 进程是 device（gpu）侧进程（记录实际 cuda kernel 的执行和一些性能相关的数据）

device timeline 比较稀疏的情况下训练性能较差，GPU 利用率较低，可能需要排查下训练代码是否有问题

19.6 显存泄露排查

https://pytorch.ac.cn/docs/stable/torch_cuda_memory.html
